1 New Code/Dev stuff

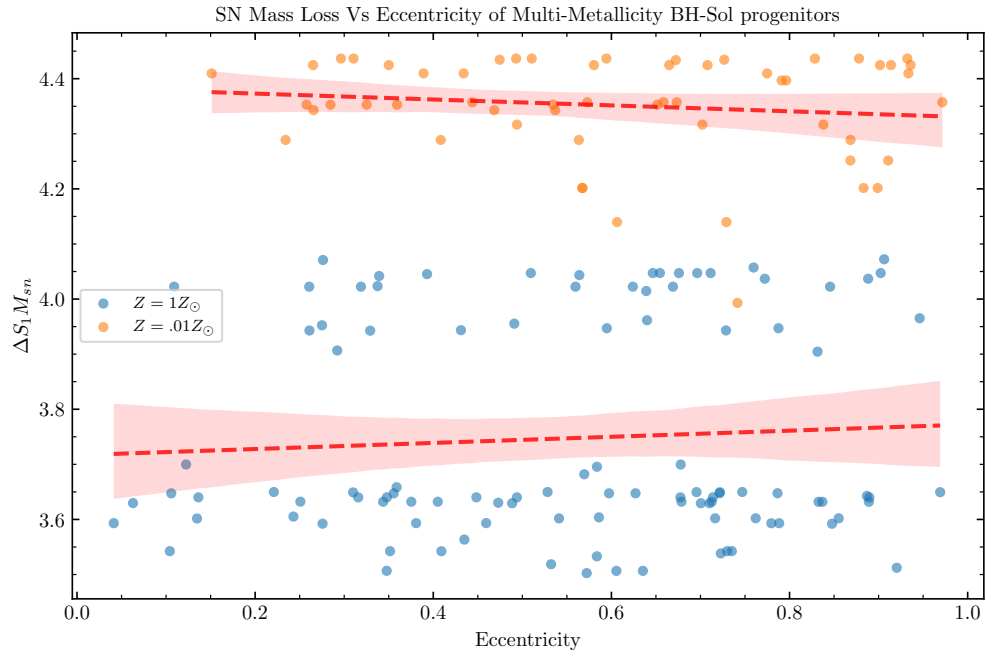

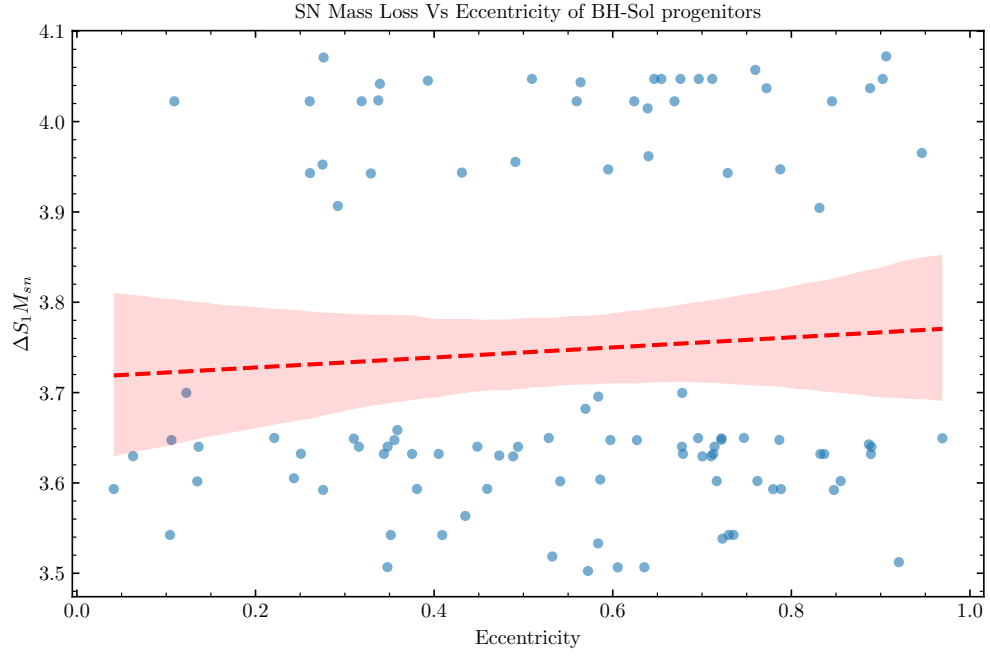

Setup `BH-Sol_Filter.py` to use multiprocessing, cutting time down for filtering into the BH-Sol candidates massively.

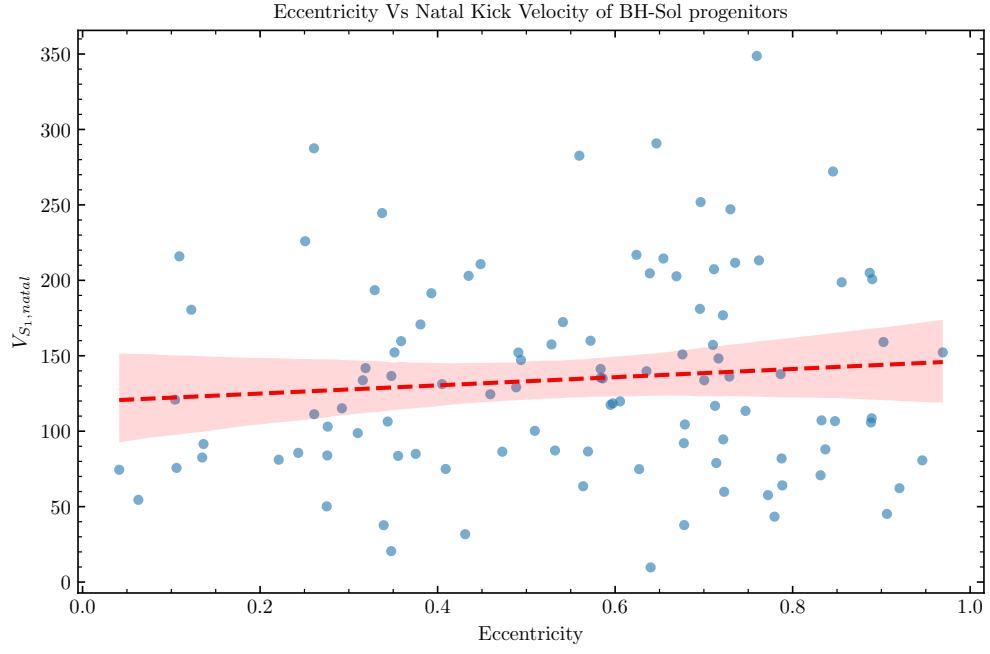

2 Questions

- Is it possible to get access to some other Quest partitions? Namely, “short”, but possibly also Trident or something. Currently using a lot of small (5 minute) sbatch jobs when filtering pops, and the `ciera-std` partition is typically full, or has a longish queue for jobs.
- How should i sort for failed CE systems? My plan was to find the init CE mass distribution from the BH-Sol pop, constrain the main pop to that, and then constrain that to ones where their next step is merging
- Next steps probably involve higher res grids + 10 mill sim?
